

A GUIDE FOR ONE SPECIFIC PERSON

The Person Who Completes Roman

How to be the partner who covers his blind spots, protects his energy, and turns his momentum into finished results — without ever asking him to run on his weakest gears.

Built from Roman's CliftonStrengths® full 34 & profile analysis

Read alongside: his ADHD (combined type) context

For a co-founder, right hand, manager, partner, or close collaborator

Compiled 12 July 2026

— Why this guide exists

Roman is a high-voltage engine: he opens doors, reads a messy situation fast, names the problem, rallies people, and launches. What he is *not* wired for is the quiet, repetitive follow-through that turns a launch into a finished, durable result. That's not a flaw to fix — it's a shape to complete.

You are the person who completes it. This guide is written to **you**. Its single organizing principle:

THE CORE RULE: COMPLETE HIM, DON'T CORRECT HIM

Don't try to make Roman disciplined, cautious, or detail-obsessed — and don't build the partnership on those weak muscles. Every hour he spends forcing his lowest gears is an hour of drained energy and worse output. Your job is to *own* those functions so he never has to. He brings the fire; you build the fireplace.

1 Roman in 60 seconds

His engine (top 10)

Woo Input Restorative Communication
Positivity Activator Command Analytical
Adaptability Developer

Influence + problem-solving + information. He wins the room, diagnoses fast, and moves first. Four of the top seven are *Influencing* themes.

Where he runs out of road (bottom)

Discipline #23 Focus #27 Arranger #28
Context #30 Deliberative #31 Maximizer #33
Relator #34

His whole *Executing* domain sits low: routine, sequencing, follow-through, risk-checking, finishing, and slow-built 1:1 depth.

THE CONNECTION THAT MAKES THIS URGENT

Roman also has ADHD (combined type). His weakest strengths — discipline, focus, organization, follow-through — are precisely the executive functions ADHD taxes hardest. So you are not just a "good complement." You are his **external executive function**: the human scaffolding that makes his talent land. This is the single highest-leverage support in his life.

2 The profile you need to have

You are, in one word, his **Integrator** (or Operator, or Chief of Staff). Where he is the visionary catalyst, you are the one who lands the plane. The strengths that complete him are the mirror image of his gaps:

Your strength	Covers his gap	What it looks like in practice
Discipline / Consistency	Discipline #23	You bring routines, deadlines, and a stable process he can plug into.
Focus	Focus #27	You guard the single priority and say no to initiative #8, #9, #10.
Arranger / Responsibility	Arranger #28, execution domain	You sequence the work, assign owners, and track commitments to done.
Deliberative / Context	Deliberative #31, Context #30	You run the risk check before irreversible calls and ask "have we seen this before?"
Maximizer / Achiever	Maximizer #33	You refuse to let a "good enough" result ship half-finished; you close it out and raise the bar.
Relator / deep empathy	Relator #34	You maintain the deep, quiet 1:1 trust after his Woo opens the door.

You don't need all six. The two that matter most: **Focus** (protect the one priority) and **Responsibility/Achiever** (nothing falls through). Everything else is a bonus.

3 Your core job, in four verbs

1 • FINISH

He starts brilliantly and loses interest once the interesting problem is solved. **You own the last 20%**. Every initiative gets a written owner, a deadline, a completion criterion, and a check-in date — before he moves to the next shiny thing.

2 • FOCUS

His Activator + Adaptability + Restorative will spin up new fires endlessly. **You hold the line on one main priority at a time**. When he pitches a new launch, your default question is: "Great — which current thing do we drop or finish first?"

3 • FILTER

Before irreversible decisions, you insert the pause his Deliberative won't. Not to slow everything — only the one-way doors. Split decisions into reversible (let him move fast) vs. irreversible (60-second risk check first).

4 • FUEL-GUARD

His energy comes from people, novelty, and crisis — and burns out the same way. **You watch the tank** and protect recovery, because he won't feel "done" and won't stop on his own.

4 The operating system (concrete rituals)

Structure beats willpower — for anyone, but especially for an ADHD brain. These are the recurring rituals that make the partnership work. Keep them lightweight and visible.

The weekly checkpoint (non-negotiable)

One short, fixed, recurring meeting. Three questions only:

- **What did we commit to last week?** (You keep the list — not his memory.)
- **What's actually finished vs. still open?** (Close loops or consciously kill them.)
- **What is *the one* priority for next week?** (Singular. You enforce the singular.)

The open-loops list

A single shared, visible list of every started-but-unfinished initiative. His profile *accumulates* these. Your rule: **nothing new starts until something old is finished or deliberately dropped**. Make the trade-off explicit and out loud.

The "finish before you start" rule

When he arrives energized with a new idea (he will, often), don't kill it — **park it**. "Love it. It goes on the list. It starts when X finishes." This respects his Activator while protecting completion.

WHY RITUALS, NOT REMINDERS

Don't rely on nagging — it drains you and he'll resent it. Rely on **a system he agreed to in advance**: a standing meeting, a shared list, a decision rule. The structure does the enforcing, so the relationship doesn't have to.

5 Guardrails: his specific blind spots

His own profile analysis flagged these risks. Here's what each looks like and your countermove.

Risk	How it shows up	Your countermove
Crisis addiction	Calm work feels boring; he collects "burning" problems and becomes everyone's rescuer until he can't rest.	Help him separate "I find this interesting to solve" from "only I can solve this." Cap it: one real crisis at a time.
Too many launches	Started initiatives pile up with no fixed next step; constant activity, little completion.	Be the owner of deadlines, completion criteria, and the kill-switch. (This is job #1.)
Dominating the room	Woo + Communication + Command + Activator = his voice fills the space; quieter people agree because there's no room to disagree.	Get him to ask others first and voice his own position last. You watch for the unheard voices.
Speed vs. evidence swings	He lurches between "decide now" and suddenly "we need more data."	Reversible → move fast. Irreversible → mandatory short risk check. Make the rule, not the mood, decide.
Rescuing people	He invests more in someone's growth than they want, and takes their lack of progress personally.	Before he helps: "Do they want a listener, a thinking partner, or a solution?" Protect his energy from one-sided rescue.
Social/energy burnout	Calendar full of meetings; must always be "on" and energizing; hard to sit with no external reaction.	Protect white space. Normalize that his worth isn't measured in visible output or applause.

6 How to talk to him so it lands

He has Command and Activator near the top — he responds to directness and action, and bristles at vague hedging or being slowed for no reason. Empathy is actually high in his profile (#11), so he's not emotionally blind — he'll hear you if you're straight.

Say this

- "Which one thing matters most this week?"
- "This is a one-way door — 60-second risk check before we commit."
- "Love it. On the list. Starts when X is done."
- "What does 'finished' look like here?"
- "You've picked up three fires. Which one is actually yours?"
- "Let the others go first — then land it."

Avoid this

- Vague nagging with no system behind it.
- "You never finish anything" (shame, not structure).
- Slowing reversible decisions "just to be safe."
- Long hedged preambles — get to the point.
- Trying to make him love routine for its own sake.
- Public correction — do it 1:1.

7 Warning-sign dashboard

Intervene early — he won't self-report these until he's already depleted.

- **The open-loops list is growing faster than it's closing** → freeze new starts; run a completion sprint.

- **He's taken on a second or third "crisis"** → name it out loud; hand two back.
- **He's irritable, restless, or can't switch off** (his words: "can't rest," internal tension) → protect recovery; check sleep and exercise (his proven regulators).
- **He's over-investing in someone who isn't reciprocating** → ask the "do they even want this?" question.
- **Decisions are getting erratic** (too fast then too slow) → return to the reversible/irreversible rule.

8 What winning looks like

You'll know the partnership is working when: his launches actually **finish** and become durable; he runs **one** priority at a time instead of ten; irreversible decisions get a beat of caution while everything else stays fast; and he has genuine recovery time instead of running on adrenaline until he crashes.

The formula the analysis landed on for where Roman is strongest: **a hard problem + lots of people + room to influence + a fast launch + a visible result**. Your contribution is the invisible fifth element that makes the other four pay off: **it gets finished, and it lasts**.

ONE LINE TO REMEMBER

He is the one who gets it started and gets people moving. You are the one who makes sure it crosses the finish line — and that he's still standing when it does.

This guide interprets Roman's CliftonStrengths® full-34 results and personal profile analysis, read alongside his ADHD context. CliftonStrengths is a strengths-framework tool, not a clinical instrument. Nothing here is medical advice; the ADHD points complement, and don't replace, his clinician's guidance.
